

## WESTERN NATIVE MIX

Slender Wheatgrass	50 lb.
Beardless Wheatgrass	25 lb.
Thickspike Wheatgrass	
Sideoats Grama	
Western Wheatgrass	
Green Needle Grass	

*Suggested Seeding Rate 15-20 lbs. per acre*

A mixture of cool and warm season grasses that are native to the Western U.S. This mix can be used in a variety of situations from reclamation to ornamental landscapes.

*Several City and County specific mixes are available upon request. With care, natives can bring the site back to a close resemblance of pre-disturbance.*

## SANDY SOIL MIX

Western Wheatgrass	50 lb.
Thickspike Wheatgrass	25 lb.
Switchgrass	
Annual Ryegrass	
Sideoats Grama	
Little Bluestem	
Sand Dropseed	
Green Needle Grass	

*Suggested Seeding Rate 20-30 lbs. per acre*

*Broadcast Rate 30-35 lbs. per acre*

A mixture of warm-season and cool-season grasses for soils that are sandy to loamy and even clay based. Suited best for range conditions and pasture production in livestock operations. Range of adaptation is below 6500 ft. elevation.

## We Specialize In Custom Seed Mixes

## SHORTGRASS MIX

Sideoats Grama	25 lb.
Buffalograss	
Blue Grama	

*Suggested Seeding Rate 10-15 lbs. per acre*

*Broadcast Rate 20-30 lbs. per acre*

Drought tolerant, sod-forming, warm-season grasses for the short grass prairie. Produces choice forage for livestock. Often planted on the outside corners of irrigated circles. Adapted below 6,000 ft. elevation. A great native mix that works for turf applications as well.

## **NATIVE GRASSES, FORBS AND SHRUBS**

A "native" is normally defined as the plant material that existed in North America before the Europeans arrived. These species demonstrate amazing tenacity once they are established. Natives are tolerant to extremes of heat or cold, drought and a variety of other harsh environmental conditions. Seed and seedling characteristics of natives are different from those of most domesticated crops or turf grasses. Seedling vigor generally is lower than that of many domesticated plant species. Germination can be somewhat prolonged due to naturally occurring seed dormancy. Warm-season natives can often take several years to reach maturity with the short growing season of the Intermountain West.

*Successful establishment requires attention to detail in seedbed preparation, seeding and early management. With care, natives can bring the site back to a close resemblance of pre disturbance.*

## **WARM AND COOL SEASON GRASSES**

Most grasses are categorized as either warm or cool season depending on ground temperatures required for germination, and when the majority of their growth occurs. Cool season grasses begin their growth cycle early in the spring, those grasses will go through a dormant cycle in the hottest months of the summer, and then begin active growth again in the fall. Cool season grasses are normally easiest to get started and produce more due to the longer growing season. Warm season grasses need a soil temperature of around 60 degrees F to germinate, and will go into dormancy at the first frost.

## **COMMON SHRUBS**

4-Winged Saltbush  
Rubber Rabbitbrush  
Shadscale Saltbush  
Winterfat  
*More species available*

## **COMMON WETLAND SPECIES**
